

BUSINESS PLAN

RenovAI

AI-powered visualization of residential renovations

Model: SEBRAE — How to Write a Business Plan

Founder: Bruno Wasserstein

Product: renovai.ia.br (MVP in production)

Version: public and generic — June 2026

Public and deliberately generic version. To protect the company's strategy, methodology and financial model, proprietary figures, cost and conversion parameters, commercial rates and partnerships and personal data have been omitted or replaced with illustrative ranges. The market figures cited derive from public sources referenced in the text.

Notice — Public and Generic Version

***Why this plan is generic.** This is a **public and deliberately generic** version of RenovAI's business plan. For **company security and protection** — protecting the business plan, the proprietary methodology, the revenue model and the competitive strategy — specific financial figures, cost and conversion parameters, commercial rates and partnerships, differentiating technical details and the founder's personal data have been **omitted or replaced with illustrative, conservative ranges**.*

The document follows the SEBRAE template and presents only the level of detail appropriate for a broad audience. The market figures cited derive from **public sources referenced in the text**. The real strategic content — unit economics, detailed projections, acquisition tactics and the product's internal engineering — is kept in a **restricted internal version**, available only under a confidentiality agreement.

In short: what is here is true, but generic. What gives RenovAI its competitive advantage is deliberately not here.

Section 1 — Executive Summary

1.1 Summary of Key Points

RenovAI is a Brazilian digital artificial-intelligence platform for residential-renovation planning, aimed at the general public rather than professional architects. In the product, the user visits renovai.ia.br, describes a room (type, style, budget and preferences) and receives a photorealistic image of the renovated space together with a list of suggested furniture and items. The MVP is in production and has been validated technically with a controlled base of real users; this public version does not disclose usage metrics.

The problem addressed is the uncertainty that precedes spending on a renovation. In Brazil, about **82% of homes are built without a qualified professional** (CAU/Datafolha, 2022), and a residential architecture project costs, on average, between **R\$ 55 and R\$ 140 per square metre** (GetNinjas, 2024; Habitissimo, 2024), a sum hard to justify for a light renovation. RenovAI addresses this access gap by delivering a reliable visualisation before the purchase.

The business model is simple and common to free consumer applications: the visualisation is **free** to maximise adoption, and revenue comes from indirect, low-friction sources, mainly **commission/affiliate revenue on furniture** the user would buy anyway, with **optional paid plans** for heavier users and a possible future **marketplace**. The structure is fully digital, cloud-native and low-fixed-cost. The operation was initially self-funded by the founder (bootstrapping), and non-dilutive public innovation grants are under consideration.

Viability indicators (qualitative — details in the internal version)

Indicator	Characterisation (public version)
Cost structure	Lean and cloud-native; low fixed cost; no inventory or logistics
Variable cost per project	Low and falling, tracking the decline in generative-AI prices
Initial investment	Bootstrapped by the founder; specific figures not disclosed
Revenue model	Commission/affiliate + optional paid plans + future marketplace
Funding	Non-dilutive public grants under evaluation

The concrete financial figures (investment, unit cost, break-even and projections) appear only in the restricted internal version, to protect the company.

1.2 Entrepreneur Profile

Field	Value
Founder	Bruno Wasserstein
Education	Computer Science undergraduate — Inteli (São Paulo, Brazil)
Role	Product strategy, software architecture, AI development and business management
Contact	Available on request

Personal data (address, ID, phone and detailed career history) have been omitted for security in this public version.

Motivation: to democratise access to interior design. Traditional architecture services are expensive and not very iterative, and generative AI created, for the first time, the possibility of making this access scalable and affordable.

1.3 Company Data

Field	Value
Trade name	RenovAI
Website	renovai.ia.br
Company registration	Under incorporation
Sector	Information Technology — digital platform with AI applied to interior design and residential renovation
Stage	MVP in production, technically validated; no active monetisation

1.4 Mission

"RenovÁi exists to democratise access to interior design, giving anyone the certainty of how their space could look, before spending a cent."

The product is not visual entertainment: it is an instrument of **confidence before the purchase decision**, reducing the fear of getting a renovation wrong.

1.5 Sectors of Activity

Sector	Mark
Commerce	()
Industry	()
Services	(X)

Subsector: Information Technology — digital SaaS platform with generative AI applied to residential renovation and decoration.

1.6 Legal Form and Tax Regime

The intention is to incorporate a **single-member limited liability company (SLU)** under the **Simples Nacional** regime, a common and suitable form for technology startups: it limits liability to the share capital, allows future conversion to a multi-partner company, and supports the IT-services tax bracket. In the initial revenue band, the tax burden under Simples Nacional (Annex III) is the lowest possible. The definitive classification and the treatment of commission revenue will be confirmed with an accountant at incorporation.

1.7 Share Capital and Sources of Funds

The share capital will be defined at incorporation, at a level compatible with the lean structure of the operation. The initial ownership is fully the founder's, with the possibility of phased entry of strategic partners through a standard vesting agreement (usual cliff and linear-vesting clauses). The planned sources of funds are generic and common to the stage: **own capital (bootstrapping)** and **non-dilutive public innovation grants** under evaluation. Specific amounts are not disclosed in this public version.

Section 2 — Market Analysis

2.1 Customer Study

RenovAI broadly serves people who renovate, decorate or reorganise the home they already live in, without hiring a professional for a light renovation. These are people who have easy access to inspiration (social media, reference sites) but struggle to turn that inspiration into a confident decision about their own space.

For planning purposes, a few customer profiles are considered, described here generically:

Persona	Profile	Main need
A — Decided renovator	Adult, middle class, renovating a room	Certainty before spending
B — Urban dweller	Young adult, first apartment	Turn inspiration into a decision
C — Compact higher-income owner	Young, higher income, valued small flat	A quality result, fast
D — Local artisan	Supplier for a future marketplace	Reach buyers with a defined project

The segmentation and per-persona monetisation strategy (who subsidises whom, tickets and revenue mix) is proprietary and is not in this public version.

Market Size (TAM, SAM, SOM)

The estimate follows a bottom-up methodology based on public sources. The **total market (TAM)** is the annual spending of Brazilian urban households on home goods; the **available market (SAM)** restricts it to households with purchasing power and service consideration; and the **obtainable market (SOM)** is the conservative share RenovAI can reach, treated here only qualitatively.

Layer	Value	Methodology / source (public)
TAM	~R\$ 92 billion/year	~67.7 million urban households (FJP, 2023) × average home-goods spend (ABCasa/IEMI, 2024)
SAM	~R\$ 30.8 billion/year	TAM filtered by classes A–C (ABEP, 2024) and service consideration (CAU/Datafolha, 2022)
SOM	Conservative target	Small initial penetration of the SAM — specific value kept in the internal version

The context reinforces the opportunity: the home-goods sector moved about **R\$ 102 billion in 2024** (ABCasa/IEMI, 2024); **82% of homes are built without a qualified professional** (CAU/Datafolha, 2022); and a large number of households live with some form of housing inadequacy (FJP, 2024).

2.2 Competitor Study

The Brazilian AI-assisted interior-design market is more crowded than a first read suggests, but the segments differ. There are **direct Brazilian competitors**, among AI-only tools and human-assisted services (for example Arquiteto de Bolso, DecoraGPT, IAdecora and Archie). Internationally, references that help frame the category include **RoomGPT** (pure-AI, web, freemium), **Houzz** (marketplace and professional community), **Havenly** (AI + human + marketplace) and **Wayfair** (retailer with integrated generative AI, absent from Brazil); the closure of **Modsy** (fully human 3D rendering) illustrates the difficulty of scaling models that depend on manual work per project.

Criterion	RenovAI	AI-only tools	Human-assisted services
Price	Free (MVP)	Free / paid	From R\$ 149
Delivery	AI, in minutes	AI, minutes	Human, days
Localisation (PT-BR, R\$)	Yes	Varies	Yes
Mobile-first experience	Yes	Mostly web	Mostly web

RenovAI consciously positions itself between a pure-AI tool (speed) and a curated marketplace, without the marginal cost of human designers and adapted to the Brazilian market (prices in reais, local brands, native Portuguese). Generative AI itself is an increasingly commoditised resource; differentiation comes from **deep localisation**, a mobile-first experience and ease of use for non-experts, supported by a low operating cost.

2.3 Supplier Study

The operation relies on infrastructure and AI suppliers common to the sector: a **serverless cloud provider** (execution and deployment), a **managed database, authentication and storage service**, a **rate-limiting service** and

generative-AI providers for image generation and editing and text interpretation. The sourcing strategy uses **multiple providers with fallback**, so that the unavailability or price change of one provider does not interrupt the product. The commercial names, contracts and specific rates of each supplier are not disclosed in this public version.

Section 3 — Marketing Plan

3.1 Main Products and Services

From a description or a photo of a room, the product in production delivers a **photorealistic image of the renovated environment** and a **list of suggested furniture** linked to real products, in minutes and at no cost to the user. The proposition combines three elements that are rarely found together in the Brazilian market: instant AI generation, deep localisation (prices in reais, Brazilian brands, native Portuguese) and a direct path from visualisation to purchase. RenovAI acts in **light renovation, decoration, furniture, painting, spatial organisation and preliminary visualisation** — it does not replace the work of an architect, interior designer or engineer.

3.2 Price

During the current phase, the product is **free**, to favour adoption and validation. The planned revenue model is the standard for free consumer applications, based on indirect sources:

- **Commission/affiliate revenue** on furniture and items the platform originates — the user would buy them anyway, and revenue tracks the value generated;
- **Optional paid plans** for heavier or professional users;
- A future **marketplace** connecting local suppliers to buyers who already have a defined visual project (medium-term).

Commission rates, specific commercial partners and revenue-activation tactics are proprietary and not in this public version.

3.3 Promotional Strategies

Acquisition is mostly low-cost and digital:

- **Organic / SEO** and content, leveraging the strong interest in renovation and decoration inspiration;
- **Strategic partnerships** with retailers and developers;
- **Native virality**, since the visual result is naturally shareable on social media;
- **Paid media**, introduced only when revenue can sustain the cost of acquisition.

3.4 Commercialisation Structure

The channel is **100% digital, with no human sales force**. The user discovers the product, generates the project and proceeds to purchase autonomously, supported by a conversational assistant and e-mail support. Tracking uses standard funnel metrics (sign-up, briefing completion, successful generation, sharing and, in the future, product clicks and conversion), under consent and data transparency. The values and targets of these metrics are not disclosed in this public version.

3.5 Business Location

The business is **digital and cloud-native**, with no physical storefront, with an administrative base in São Paulo. The specific tax address is not disclosed in this public version.

Section 4 — Operational Plan

4.1 Layout and Infrastructure

RenovAI is a mobile-first web application supported by services for authentication, database, storage, internal APIs and external generative-AI services. The architecture, described at a high level, is organised in layers:

- **Frontend**, mobile-first, in modern web technologies (React + TypeScript + Vite);
- **Application layer / internal APIs** in serverless functions, with authentication, rate limiting and provider routing;
- **Managed database, authentication and storage**, with row-level access control (RLS);
- **Generative-AI services** for image generation, briefing interpretation and recommendation, with **a premium multimodal model as the primary and alternative providers as fallback**;
- **Storage of results** and a review, history and export interface.

The specific AI models and the parameters and prompt techniques that differentiate the quality of the result are proprietary and not in this public version.

Security treats the handling of personal data and home images as a priority, with authenticated sessions, row-level access control, rate limiting, input validation and attention to the Brazilian data-protection law (LGPD): minimisation, purpose, deletion and transparency.

4.2 Service Capacity

Being cloud-native and serverless, the platform scales automatically with demand, with no servers to manage. The **marginal cost per generated project is low** and tends to fall with the general decline in generative-AI prices; a **fair-use policy** (a limit of free generations per user) protects the worst case and induces conversion to the paid plan. The exact cost-per-volume figures are kept in the internal version.

4.3 Operational Processes

The main processes, described generically, are:

- **Project generation** (automated): the user provides the room and preferences, the platform interprets the briefing, generates the image and the item list, and saves the result to the history;
- **Image editing and variations** (automated): the user requests new versions in other styles and compares alternatives;
- **Affiliates** (planned, after incorporation): clicks on recommended products lead to partner stores;
- **Retailer portal** (semi-automated): store and catalogue registration for recommendation;
- **Customer support**: self-service and e-mail support.

4.4 Personnel Needs

In the current phase, the operation is run by the founder (a lean structure), supported by AI tools in development. As revenue stabilises, phased entry of partners and collaborators is foreseen in the commercial, marketing and technical areas. The revenue thresholds that trigger each hire are kept in the internal version.

Section 5 — Financial Plan

Note. This is the most sensitive section of the plan. To protect the company, the specific financial figures — investments, working capital, unit cost, fixed costs, income statement (DRE), viability indicators (break-even, profitability, rentability and payback) and the month-by-month projection — are **not disclosed in this public version**. Only the **principles** of the financial model are presented. The full detail is kept in a restricted internal version, available under a confidentiality agreement.

5.1 to 5.4 — Investments and Working Capital

The operation requires a **low initial investment**, typical of a digital business with no inventory, no storefront and no logistics. Pre-operational investments and working capital follow this lean structure. The figures were funded by the founder (bootstrapping) and are not disclosed here.

5.5 — Revenue

Revenue comes from indirect sources: **commission/affiliate revenue** on originated sales, **optional paid plans** and, in the medium term, a **marketplace**. During validation, the product is free and monetisation is not yet active. Revenue estimates are handled in the internal version.

5.6 to 5.11 — Costs

The cost structure is **lean and cloud-native**: a low fixed cost (low-usage infrastructure, no own servers) and a **variable cost per generation** dominated by AI usage, which has been falling with the decline in generative-AI market prices. A fair-use policy caps the worst-case cost. Initial taxation follows Simples Nacional (Annex III), at the lowest rate band. The specific unit and fixed costs are not disclosed in this public version.

5.12 to 5.13 — Income Statement and Viability Indicators

The viability of the business depends less on margin per unit and more on **validating user adoption and conversion with proprietary data**, for which the low fixed cost provides runway. The income statement and the viability indicators (break-even, profitability, rentability and payback) appear only in the internal version.

5.14 — Revenue Model

The model combines mechanisms common to digital products: a **free, commission-funded core experience**, **optional paid plans** for heavier users and a future **marketplace** connecting suppliers to buyers with a defined project. The rates, partners and conversion parameters are proprietary.

5.15 to 5.19 — Assumptions and Conclusion

The financial assumptions in this public version are **illustrative and conservative**, and do not constitute a committed projection. Full financial validation depends on conversion data collected in production. In summary, the business shows **demonstrated technical feasibility and a common, plausible revenue model**, contingent on validating the conversion hypotheses — whose figures are kept in the internal version for company security.

Sections 6, 7 and 8 — Scenarios, SWOT and Plan Evaluation

6 — Scenario Construction

The analysis considers three qualitative scenarios, without disclosing the figures that parameterise them:

- **Pessimistic:** adoption and conversion below expectations; the response is to preserve cash thanks to the lean structure, reduce variable costs and extend the validation period before investing in paid acquisition.
- **Realistic:** gradual adoption and progressive activation of commission revenue, sustained by the low fixed cost.
- **Optimistic:** faster traction, bringing forward paid plans and the marketplace and enabling grant funding and investment.

The values that distinguish each scenario (users, conversion, revenue and break-even) are kept in the internal version.

7 — Strategic Evaluation (SWOT Matrix)

Strengths	Weaknesses
Deep localisation for the Brazilian market (language, prices, brands); mobile-first experience; low operating cost; product already in production.	Early-stage product; revenue model still under validation; lean team; dependence on third-party AI services.
Opportunities	Threats
Large, under-served market; falling cost of generative AI; a category validated internationally yet under-explored in Brazil; non-dilutive public funding.	Entry of better-funded competitors; commoditisation of generative AI; exchange-rate pressure on cloud costs; restrictions in affiliate programmes.

8 — Business Plan Evaluation

8.1 Feasibility

The plan demonstrates **technical feasibility and initial robustness**: a functional MVP in production, validated technically with a controlled user base, on a lean cost structure that provides runway to validate the conversion hypotheses. The revenue model is common and plausible; its confirmation depends on proprietary adoption and conversion data. The quantitative viability indicators are kept in the internal version for company security.

8.2 KPIs to Monitor

Generically, the indicators tracked include reach (registered users), real usage (active users and generated projects), activation (sign-up to first generation), purchase intent (product clicks) and monetisation (conversion to a paid plan). The numeric targets are not disclosed in this public version.

8.3 Next Steps

The short-term priorities are to consolidate the architecture, mature product recommendation, formally incorporate the company, activate the first revenue sources and evaluate grant programmes. The detailed roadmap is in the internal version.

8.4 Pivot Criteria

The model will be revisited if adoption, activation or conversion remain persistently below what is needed to sustain the operation, preserving the core thesis (a reliable visualisation before the purchase) rather than abandoning it. The specific thresholds are kept in the internal version.
